Publisher Summary. The scientific knowledge we have thereby obtained forms a profound basis for the completion of prophylactic measures against furunculosis, and for further progress in fish immunology and disease prophylaxis for the next century. Furunculo- sis disease problems and the practice of marketing gutted fish,...

Diagnosis of Furunculosis: The Tools - ScienceDirect
Abstract. Aeromonas salmonicida, one of the few non-motile members of the genus Aeromonas, within the family Aeromonadacea, has a global distribution and comprises several subspecies, which for practical purposes may be separated both biochemically and genotypically into two major

Furunculosis is an important disease in wild and cultured stocks of salmonid and other fish species and can have significant negative economic impacts on aquaculture operations. Motile Aeromonas species have also been implicated as the causative agents of various fish septicemias [5].

Background. Furunculosis caused by Aeromonas salmonicida spp salmonicida is a bacterial disease affecting salmonid species, including cultured and wild Atlantic salmon (Salmo salar L.) (reviewed in [1,2]), salmonids and other fish species [3-7]. Disease may have local and systemic, acute, subacute and chronic forms with diverse symptoms ranging from erratic swimming and slight darkening of skin ...

Furunculosis: Multidisciplinary Fish Disease Research presents a fascinating insight into the opinions and the controversies which have led to current knowledge of this disease. It is the first book to cover one single fish disease by presenting not just the reviews, but also critical examination of the progress made by various disciplines.

*Chemotherapy of Furunculosis - ScienceDirect*

Aeromonas salmonicida, a non-motile aeromonad, is the aetiological agent of a bacterial septicaemia in fish, called furunculosis [2–4]. Furunculosis is an important disease in wild and cultured stocks of salmonid and other fish species and can have significant negative economic impacts on aquaculture operations.

The genome of Aeromonas salmonicida subsp. salmonicida ... Furunculosis is highly contagious disease that affects fish of all ages. Also known as infection with Aeromonas salmonicida, the infection causes high mortality in salmonids, though some other species of fish are affected.

Publisher Summary. This approach was transferred to the diagnosis of furunculosis in the 1970s but has neither led to a suitable diagnostic assay nor to a deeper understanding of the fish's response towards natural A. salmonicida infections. In contrast to the role of antibodies in vaccination against furunculosis,...
Research on furunculosis of Salmonidae caused by Aeromonas salmonicida commenced in Germany over 100 years ago (Emmerich & Weibel 1894), and it is the purpose of this book to record the course of events since then. Although vaccines are now available, there are many aspects of the disease still awaiting a solution.

Furunculosis: multidisciplinary fish disease research.
The bacterium is known as Aeromonas salmonicida. Furunculosis is only one of several clinical diseases associated with A. salmonicida. Infections of fish with A. salmonicida are not necessarily associated with clinical disease. A. salmonicida infects a vast range of hosts in fresh water and in the marine environment.
